EXECUTIVE SUMMARY

What This Business Is

Krystal's Beaded Bliss (KBB) is a Lagos-based handcrafted jewellery brand specialising in bead bracelets, necklaces, earrings, and sets — available both as ready-to-wear pieces and as fully custom builds designed around the customer. The brand operates through a purpose-built e-commerce platform that handles browsing, custom design, ordering, payment confirmation, order tracking, and customer support, backed by an admin system for day-to-day management.

KBB is a sister brand to **The Sweet Soirée**, a separate Lagos-based hair accessories and beauty storefront under the same founder. The two operate as independent stores with their own catalogues and identities, cross-promoted to share audience reach.

"Every piece is hand-strung with intention — from ready-made collections to fully custom creations built around you."

MARKET

Who It's For

KBB serves customers looking for personal, expressive accessories rather than mass-produced jewellery — primarily young women in Lagos and across Nigeria who shop via mobile and are comfortable completing purchases over WhatsApp and bank transfer, the dominant commerce pattern in the market.

Ready-to-wear shoppers — customers who want a finished, in-stock piece delivered quickly — browsing by category (bracelets, necklaces, earrings, sets) and checking out directly.

Custom-piece customers — buyers who want something built specifically for them — choosing bead type, colour, and charms to create a one-of-a-kind item.

Gifting occasions — customers shopping for birthdays, anniversaries, and other occasions where a personal, handcrafted item carries more meaning than a generic gift.

Repeat & referral buyers — the existing base built through word of mouth and social media, who return for new collections or recommend the brand onward.

How It Works

The platform is built as a full online store rather than a simple catalogue, covering the entire journey from discovery to delivery on both the customer-facing site and an internal admin panel.

Customer Journey

1. Browse & Discover

Customers explore the homepage, shop page, or specific categories. A search bar and category filters (bracelets, necklaces, earrings, sets) help narrow results quickly.

2. Product Detail

Each piece has its own page with an image gallery, description, pricing, and quantity selection before adding to cart.

3. Build a Custom Piece

A guided 5-step builder — piece type, bead type, colour, charms, and contact details — produces a live estimated price and submits a custom order request.

4. Cart & Checkout

Customers review their cart, enter delivery details, then complete payment via bank transfer and upload a receipt directly on the site.

5. Confirmation & Tracking

Every order receives a unique order number (e.g. KBB-A3X9PQ). Customers can return anytime to the tracking page to see live status — pending, confirmed, processing, shipped, or delivered.

6. Support

A dedicated complaint form lets customers flag issues against an order number, routed directly to the admin for response.

Behind the Scenes — Admin Panel

Day-to-day operations run through a private admin dashboard, accessible only with authenticated credentials:

Dashboard — at-a-glance view of total orders, pending orders, pending custom requests, open complaints, and total revenue.

Product management — add, edit, hide, or delete products, with direct image uploads — no developer needed to update the catalogue.

Order management — view full order detail including items, customer info, and uploaded payment receipts; update status with one tap.

Complaint management — review customer complaints by order number and respond directly, tracking each through open, in review, and resolved.

Custom builder configuration — control which bead types, colours, charms, and base prices are offered in the custom builder — fully editable without touching code.

INFRASTRUCTURE

How It's Built

The platform is built on a modern, low-overhead stack chosen for reliability and ease of ongoing maintenance rather than heavy infrastructure costs.

Layer	Technology	Why
Storefront	React + Tailwind CSS	Fast, mobile-first, easy to extend
Database & Auth	Supabase (Postgres)	Real-time data, secure admin login, managed infra
File Storage	Supabase Storage	Product images & payment receipts
Hosting	Vercel	Zero-downtime deploys, free at current scale

This approach keeps running costs minimal in the early stage while remaining production-grade — the same kind of stack used by venture-backed e-commerce startups, scaled down to fit a single-founder operation.

ROADMAP

Future Plans

The current platform covers the full core loop — browse, custom build, order, pay, track, complain — end to end. The roadmap below outlines the next layer of growth, grouped by what unlocks the most value first.

Near-Term (0–3 months)

Online payments — integrate Paystack or Flutterwave so customers can pay instantly at checkout, removing the manual bank-transfer + receipt-upload step and its delay.

Order notifications — automatic email or SMS updates when an order's status changes, reducing the need for customers to manually check the tracking page.

Discount & promo codes — seasonal sales, first-order discounts, or referral codes to drive repeat purchases and word-of-mouth growth.

Mid-Term (3–9 months)

Customer accounts — let returning customers save their details and view past orders without re-entering everything each time.

Reviews & ratings — social proof on product pages to build trust with new visitors.

Inventory tracking — stock counts per product so sold-out items are flagged automatically instead of being manually marked unavailable.

Cross-store bundles — joint offers or bundles with The Sweet Soirée — e.g. a beaded bracelet paired with a matching hair accessory — to grow both brands together.

Longer-Term (9+ months)

Sales analytics dashboard — deeper reporting on best-selling pieces, peak order times, and customer trends to guide what gets made next.

Loyalty program — rewards for repeat customers to increase lifetime value.

Wholesale / bulk ordering — a path for boutiques or resellers to order in volume, opening a second revenue channel beyond direct-to-consumer.

Native mobile app — if order volume justifies it, a dedicated app for a faster, more app-like shopping and tracking experience.

"The goal isn't just to sell jewellery — it's to build a brand customers come back to, and a platform that grows with it."
